# SYSTEM ID: EPANET Net 3

#### **NARRATIVE DESCRIPTION**

The EPANET Net 3 system is based on the North Marin Water District (NMWD) in Novato, CA. NMWD serves a population of around 64,000 people over an area of about 100 mi². The system has an average demand of 4.9 MGD. The network was used by Clark et al., (1994) as part of a water quality study of the system (one of the very first in the country) and employed a relatively new computer program developed by Lew Rossman with EPA called EPANET(1994). A general schematic of the system is shown below. The system had two raw water sources (represented by the square reservoirs in the schematic), two pump stations at the water sources, and three elevated storage tanks. The first of these sources is the North Marin Aqueduct which conveys water from the Russian river. It supplies water continuously while the second source, Stafford Lake, is used only during dry periods.

#### **NETWORK SCHEMATIC:**

#### HISTORY OF THE NETWORK FILE

The network was first published by Clark et al (1994), since then it has been frequently used for water quality, chlorine residual, and disinfection byproduct formation modelling in literature. The original citation and abstract are listed below.

ABSTRACT: Passage of the Safe Drinking Water Act in 1974 and its Amendments in 1986 (SDWAA) is changing the way water is treated and delivered in the United States. Under the SDWAA the U.S. Environmental Protection Agency (EPA) is required to regulate chemical contaminants and pathogenic microorganisms in drinking water. Emphasis has shifted from a primary concern with treated drinking water to attainment of standards at the point of consumption. Two regulations promulgated under the SDWAA, the Surface Water Treatment Rule (SWTR) and the Total Coliform Rule (TCR) specify treatment and monitoring requirements that must be met by all public water suppliers. This paper will examine the effect of various system variables on chlorine residual propagation. A recently proposed model (EPANET) will be utilized to examine the extent of fluid velocity and pipe radius on chlorine demand. The effect of these variables on the maintenance of chlorine residuals will be demonstrated. It will be shown that the same variables that affect the propagation of chlorine residual levels can potentially affect disinfection efficacy and the formation of disinfection byproducts.

### **SYSTEM CLASSIFICATION:**

### PIPE/LOOP HISTOGRAM:

Hoagland et al. (2015) designed a network classification algorithm for use in classifying water distribution systems as either "branched," "looped," or "gridded" based on the observed frequency of network loops with different numbers of distinct pipe segments. The frequency distribution for the Net 3 system is provided below. Using this information, Hoagland et al., classified this system as being a GRIDDED system.

| # Total Pipes:                      | 121   |
|-------------------------------------|-------|
| # Branch Pipes:                     | 32    |
| Ratio (Branch Pipes / Total Pipes): | 0.264 |

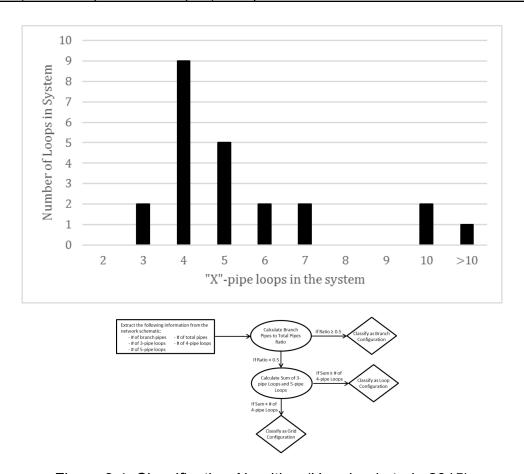

Figure 3.4. Classification Algorithm (Hoagland et al., 2015)

Hoagland, Steven & Schal, Stacey & Ormsbee, Lindell & Bryson, Lindsey. (2015). Classification of Water Distribution Systems for Research Applications. 696-702. 10.1061/9780784479162.064.

#### **NETWORK STRUCTURE METRICS:**

Building on the work of Hoagland et al., (2015), Hwang & Lansey (2017) created an expanded classification system that allows for further classification of a system as being either a transmission or distribution branched, looped, gridded, or hybrid system. Their algorithm streamlines the classification system by removing unnecessary nodes that do not contribute to the structure of the system while still retaining their use as intermediate points for demand data entry. A full description of the algorithm can be found in the cited reference.

Application of the Hwang and Lansey classification algorithm to the EPANET Net 3 system yields the following statics and associated classification:

| Parameter                     | Value                   |
|-------------------------------|-------------------------|
| Edges                         | 119                     |
| Pipes                         | 117                     |
| Nodes                         | 97                      |
| Average Diameter              | 17.9                    |
| Reduced Nodes                 | 50                      |
| Reduced Edges                 | 72                      |
| Branched Edges                | 24                      |
| Branched Index                | 0.3                     |
| Meshed Connectedness          | 0.1                     |
| Reduced Meshed Connectedness  | 0.24                    |
| Link Density                  | 0                       |
| Average Node Degree           | 2.5                     |
